

Last year was Earth's warmest on record, according to an international climate report issued Thursday by the National Oceanic and Atmospheric Administration that documents other record-breaking global warming trends of 2016.

The report is the most comprehensive assessment of the effects of climate change released by the Trump administration, and it could make it easier to refute efforts from the president and his Cabinet members to publicly discount climate science as they have frequently done in the past. However, the annual report does not detail the link between climate change and human activities such as burning coal or gasoline. Those conclusions are drawn in a separate draft portion of the National Climate Assessment highlighted by The New York Times earlier this week.

**TVNL Comment: ☐ But the Fool in the WH chose to withdraw from the Paris Climate Accord agreed to by 176 nations. ☐ Be afraid America.**
