

TVNL: ADDED AS HISTORICAL REFERENCE

After beginning his research on the AIDS pandemic in 1992, Dr. Boyd Graves discovered in February 1999 the greatest evidence, to date, of records and reports of the experiments that led to the development of what the world now knows as the AIDS virus. That document is the “1971 Flow Chart of the Special Virus Program of the United States.” Dr. Graves submitted this flowchart as evidence to the Sixth Circuit Federal Court in a case which named the President of the United States as a defendant to answer a petition acknowledging the authenticity of the Flow Chart. On January 12, 2001, the case was dismissed as “frivolous,” and then referred to the District’s Appellate Court, which ruled in favor of the lower court. Eventually, it went to the Supreme Court, which refused to hear it without giving comment as to why. Dr. Graves spoke with Final Call contributor Sultan Muhammad to explain the significance and consequences of his research.

Q: Your statement reminds me of the year 1932, when Mr. **Prescott Bush**, the grandfather of the current president, convened the first international eugenics conference here in America. I understand this year was significant for other reasons. Could you explain?

A: Many of us are aware that the Tuskegee experiment, where Black sharecroppers were injected intentionally with syphilis for the purposes of infiltrating syphilis into the Black genome. Some 60 years later, we could then say that Black people are scurrilous; syphilis runs rampant throughout Black people and, therefore, they are someone to be placed in a secondary capacity. That is particularly in line with the eugenics program where White births are encouraged and Black births are discouraged.

In 1932, the infectious agent of HIV was first tested on sheep in Iceland. That agent is called Visna. In 1932, in conjunction with the Tuskegee syphilis program, they were testing the infectious agent of HIV on an island nation. We have Visna as 30 percent of the sequences of the HIV here today. So, 1932 not only is significant for the start of a push for eugenics, i.e. a White birth order, but also the start of the testing of the infectious agent of HIV in AIDS.
