

Fluoride is a toxic waste byproduct known to damage the brain, vital organs

New Jersey is one of the few U.S. states where the vast majority of its residents are not forcefully medicated with fluoride chemicals via their water supplies. Only about 20 percent of New Jersey residents, in fact, are exposed to fluoride in water, which makes it the fourth least fluoridated state in the country. But state legislators in the Garden State are currently trying to change this by passing legislation that would mandate all public water supplies in the state to fluoridate their water.

According to the Fluoride Action Network (FAN), a health freedom advocacy group, the New Jersey legislature has been working towards enacting these new fluoridation laws without telling the public or seeking appropriate public input. And outcry from those who oppose the legislation -- the NJ League of Municipalities, the NJ Sierra Club, the NJ Business and Industry Association, the citizens' group No Fluoride New Jersey, and even a number of local water companies and utilities across the state have all objected -- appears to be going unheard.

Besides failing to make an appropriate public announcement about the bills, legislators are also withholding the fact that the toxic fluoride chemicals being proposed for water supplies is not natural, and is actually a waste byproduct of the phosphate fertilizer and aluminum production industries. As a result, those who drink it are exposed not only to fluoride's toxic effects, which include brain, thyroid, and other organ damage, but they are also exposed to arsenic, lead, radionuclides, and various other toxic chemicals that typically contaminate it.

More than 25 published papers have shown that fluoride chemicals reduce IQ levels in children, and many people across the U.S. today have dental fluorosis, a condition where teeth become mottled and brittle, as a result of overexposure to fluoride. It is also a drug that has never been approved by the U.S. Food and Drug Administration (FDA), which means its deliberate addition to public water is an illegal form of practicing medicine without a license or proper prescription.
